## Did you know ...

- Eye injuries are the leading cause of blindness among farmers.
- Farmers' eyes are the second most frequently injured body part.
- Over time, UV ray exposure can lead to cataract development and eyelid skin cancers.
- Eye injuries are more likely to occur when repairing farm machinery than when operating it.
- The most common causes of eye injuries are:
  - Flying objects - Dust particles
- Chemicals - Sun exposure
- Protective eyewear can prevent eye injuries in over 90% of cases.

Funding for the development of this safety guide was provided by the Healthy Vision Community Awards Program, a project of the National Eye Institute.

# Protecting Your Sight:

An Eye Safety Guide for Farmers

#### Safety Glasses 🛸

Safety glasses should be impact resistant with wrap-around lenses for the most complete protection. For outside work, look for safety glasses that block 99% – 100% of UV rays. Safety glasses are available for use over prescription lenses.

#### Goggles 🖛

Goggles offer good protection against front and side impact. Unvented or indirect vented chemical splash goggles provide protection from chemical vapors and liquids.

- Purchase only protective eyewear that meets American National Standards Institute performance standards – ANSI Z87.1 should be printed on the glasses or box.
- To purchase protective eyewear, visit a safety equipment retailer or talk to an AgriSafe nurse in your area. Go to www.agrisafe.org to locate a clinic near you.

### Full Face Shield (FFS) 🖛

FFS offer good protection against splashing or dust, but have a varying degree of impact resistance. You must wear safety glasses or goggles underneath a face shield for complete protection.

#### Welding Helmet 🛸

Special protection is needed during welding to prevent injury from flying sparks and exposure to light. Darkening capacity, splatter, spark, and particulate resistance will vary with helmet models.
